Product features		
Mode of operation Thermo-electric tripping device	The actuator moves the damper to its normal working position while tensioning the return spring at the same time. If the power supply is interrupted, the energy stored in the spring moves the damper back to its safe position. Thermal trip Tf1 operates if the ambient temperature exceeds 72°C. Replaceable thermal trip Tf2/Tf3 operates if the temperature inside the duct exceeds 72°C. Tf1, Tf2 or Tf3 trips cause the power supply to be interrupted permanently so that it cannot be uncancelled. The LED is lit when – there is a supply voltage, – the temperature fuses are OK and – the test switch is not pressed.	
BAE72B-S Note The function of the thermal trip and the test switch is only warranted if the actuator is connected to the power supply and has reached its operating position.		
Signalling	Two microswitches with fixed settings are installed in the actuator for indicating the damper end positions. The position of the damper blade can be read off on a mechanical position indicator.	
Manual operation	Without power supply, the damper can be operated manually and fixed in any required position Release of the locking mechanism can be achieved manually or automatically by applying the supply voltage.
